

# Documentation of flora of Rara lake and adjoining areas in mid-western region of Nepal

B. K. Basnet<sup>1</sup>

Rara National Park is the smallest national park of the country. It is rich in floral and faunal diversity. Rara is one of the sacred lakes and is listed as a Ramsar site. The aim of the study was to compile the representative flora of Rara lake and to present status of available vegetation. The research used both primary and secondary sources of data. Field visit was conducted in June, 2010 during which more than 300 plant specimens were collected. The secondary data were collected from Rara and adjoining area like Gamgadi. These data were thoroughly analyzed to understand the composition of vegetation. The study revealed the existence of about 224 flowering plant species in the area, under 173 genera and 67 families. Compositae was found to be the largest family (21 species and 17 genera) followed by Rosaceae (19 species and 10 genera).

**Key words:** Rara lake, Ramsar site, floral composition, alpine flora, flowering plants

Mugu district lies in Karnali zone in the mid-western development region of Nepal. It is inaccessible due to the lack of motorable road. There is a newly established airport at Talcha which is about two hours journey from Rara lake and Gamgadi, the district headquarters of Mugu. There is regular flight from Nepalganj and Surkhet, the regional headquarters of the mid-western region of Nepal. The main attraction of Mugu district is the Rara National Park (RNP). The park was established in 1976 with an objective of protecting the unique flora and fauna of the Humla-Jumla Region of Nepal. It was also declared as Ramsar site (number 1695) in 2007. The park covers an area of 106 km<sup>2</sup> as core area and 197.76 km<sup>2</sup> as buffer zone. The park ranges in elevation from 1,800 m to 4,039 m at Chuchemara Peak on the southern side of Rara Lake. On the northern side, the peaks of Ruma Kand and Malika Kand exist (Bhuju *et al.*, 2007).

Despite being the country's smallest national park, RNP encloses the largest lake of Nepal (area: 10.8 km<sup>2</sup>, depth: 167 m). The lake belongs to alpine freshwater category and lies at an altitude of 2,990 m. It is oval-shaped with an east-west axis. It has a length of 5 km and a width of 3 km, and drains into Mugu-Karnali River via Nijar Khola.

The physiography of the study area comprises trans-Himalayan range covering entirely the temperate and sub-alpine flora. Mountains above 4,000 m runs

along west to east with different patches of vegetation composition in different aspects around Rara lake.

The botanical exploration of Karnali zone started with the visit of Col. Bailey in 1956. He visited different parts of Karanali zone including Rara lake for botanical collection. Fifteen years later, British scientists gathered a large number of plants from this area. Stainton travelled the major parts of the zone in 1963 to explore its flora. Similarly, Itoh and Rajbhandary in 1965, and other Nepalese botanists also visited the zone on different occasions and assembled a large number of plants for herbarium, garden and other laboratory purposes (Manandhar, 1984). Ferro who visited it in 1979 has compiled limnological and biological data. Morphological, physical, chemical and biological information of Rara lake has already been published by Tokio and Yashiro in 1986.

## Materials and methods

The research is based on both primary and secondary data. For the primary information, a field visit was conducted in June, 2010 during which, more than 300 plant specimens under different families were collected as herbarium specimens, with collection number, locality and plant habit. The secondary data was based on herbaria collected from Rara Lake and adjoining areas by different collectors at different times, and deposited by them at National Herbarium

<sup>1</sup> Department of Forest Research and Survey, Babarmahal, Kathmandu  
Email: basnet\_b@hotmail.com

(KATH). Such data were further analyzed in accordance with family, generic and specific names.

The collected specimens were thoroughly examined and identified by using relevant references as Hooker (1883–1887), DPR (1994), Polunin and Stainton (1984). They were crosschecked with the herbarium specimens deposited at KATH. The nomenclature given in latest taxonomic literatures (Press *et al.*, 2000; DPR, 2001) were adopted. The herbarium specimens are deposited at National Herbarium KATH, Godawari, Lalitpur, Nepal.

## Results and discussion

The flora of the study area comprised a total of 224 species, 173 genera and 67 families of flowering plants (Annex 1). The research found Compositae to be the largest family (21 species under 17 genera) followed by Rosaceae (19 species under 10 genera), and Labiateae. They are followed by Graminae (14 species under 11 genera), Cyperaceae (13 species and 9 genera) and Umbelliferae (9 species under 7 genera). Twenty nine families were counted as least species number holding family. These included, Acanthaceae, Amaranthaceae, Asclepiadaceae, Balasminaceae, Buxaceae, Campanulaceae, Cannabinaceae, Coriariaceae, Dioscoreaceae, Dipsacaceae, Holoragaceae, Juglandaceae, Lentibulariaceae, Loranthaceae, Menyanthaceae, Onagraceae, Orchidaceae, Oxalidaceae, Phytolacaceae, Plantaginaceae, Primulaceae, Rubiaceae, Rutaceae, Tamaricaceae, Taxaceae, Thymelaceae, Urticaceae, Vitaceae and Zygiberaceae. Other 32 families had low number of species ranging from having two to eight species in each family. The family names followed by genus and species' names are arranged alphabetically (Annex 1).

Regarding the diversity of the species in the surrounding area, least number of species was observed under pine forests, especially in the planted area near Milli Chaur. High number of herbaceous plant was found in Lower Milli along the side of pasture land designated by the Park. Although collection of aquatic macrophyte remained the focus of interest during the field study, only a few numbers of such species could be collected because of difficult field situations. *Myriophyllum spicatum* under the family Holoragaceae, *Urticularia australis* under the family Lentibulariaceae and three species of *Potamogeton* were recorded during the field survey. In

addition, species like *Isolepis setacea* under the family Cyperaceae and *Rumex* under the family Polygonaceae were observed in semi-aquatic habitats.

More detailed survey of vegetation is required in order to deeply understand the availability of endemic and other endangered plant species. It is suggested that a comprehensive research be conducted in future in collaboration with academic universities within the budgetary frame of the Department of National Parks and Wildlife Conservation.

## Acknowledgements

I express my gratitude to Mr. Sahas Man Shrestha, Director General, Department of Forest Research and Survey for his encouragement to conduct this study. I am grateful to Mr. Ramesh Shakya, Mr Dipendra Pokharel and Mr. Atul Man Joshi for their initiative to provide me the grant and necessary arrangement during the field visit. I am also thankful to the Nepal Army personnel and park staff for their support in providing medical services during the period of my illness. I express my sincere thanks to senior taxonomist Dr. Keshab Raj Rajbhandari for his valuable instruction during the identification of the collected specimen.
