Antioxidant and antibacterial activities of fruit extracts of *Berberis* species from Nepal

Sarala Dhungel, Giri Prasad Joshi and Deepak Raj Pant*

Central Department of Botany, Tribhuvan University, Kirtipur, Kathmandu, Nepal

Abstract

The Himalayan region is rich in flowering plants diversity, including medicinal and wild edible plants. These plants possess variety of therapeutically important compounds, like alkaloids, flavonoids, phenolics, saponins, steroids, tannins and terpenoids in different parts. Presence of significant amount of these compounds makes a species valuable to be used as super foods or medicines. Furthermore, plant extracts especially those of fruits are basically attributed with natural antioxidants, either in form of vitamins or color-inducing pigments, which have become the target to replace the synthetic antioxidants. In this regard, fruits of *Berberis* species, one of the popular wild edible fruits of Nepal, are noted for their antioxidant property since time immemorial. The present study was done with an attempt to quantify the antioxidant potential and antibacterial activities of the fruit extracts of four taxa of *Berberis* (*B. angulosa* var. *angulosa*, *B. angulosa* var. *fasciculata*, *B. aristata* and *B. asiatica*) from Nepal and to correlate the antioxidant potential with various phytochemicals present in the extracts. Methanolic fruit extracts were used to spectrophotometrically quantify total phenolic and flavonoid contents. DPPH free radical scavenging assay and antibacterial assay were carried out in *in-vitro* condition. Preliminary phytochemical analysis revealed high polyphenol content (52.60 ± 3.73 and 58.07 ± 1.44 mg GAE/g) and better antioxidant property (35.29 ± 3.01 and 29.15 ± 2.01 µg/ml) respectively in *B. angulosa* var. *angulosa* and *B. angulosa* var. *fasciculata* than in the fruit extracts of *B. aristata* and *B. asiatica*. In contrast, fruit extracts of *B. asiatica* showed the highest total flavonoid content (27.52 ± 0.56 mg QE/g) than did by the extracts of other taxa studied. The fruit extract of *B. aristata* and *B. angulosa* var. *fasciculata* at very high concentration (200 mg/ml) showed maximum zone of inhibition (ZOI) against tested bacterial strains, *Staphylococcus aureus* and *Escherichia coli*. In contrast, *B. asiatica* did not show any ZOI for both of the tested bacterial strains. As fruits are better sources of antioxidant with greater accumulation of flavonoids and phenolics, wild fruits should be equally spaced for their better efficiency as cultivated ones.

Key-words: *Berberis* species, antioxidant, antibacterial, phytochemical analysis.

Introduction

Fruits are one of the major components of balanced diet as they supply humans with very important nutrients, like sugar, vitamins, anthocyanins and dietary fibers. For this reason, people usually grow commercial fruits in their fields for family consumption or as a sort of family earning. In addition to the commercial fruits, there are certain fruits that are freely available in the wild which are usually not sold in the market but are consumed by the local population. The wild edible fruits play a significant role in human nutrition, especially in the rural areas where they are only sources of edible fruits that the people can afford. Fruits of different species of *Berberis* are among the most important wild edible fruits of Nepal. These fruits are reported to be rich in various phytochemicals and exhibit antioxidant (Andola *et al.* 2008; Hanachi *et al.* 2006; Chandra *et al.* 2011), antimicrobial (Chandra *et al.* 2011; Dashit *et al.* 2014), anti-diabetic (Rajaei *et al.* 2011; Meliani *et al.* 2011), hepatoprotective (Eidi *et al.* 2011), antihistaminic and anticholinergic (Shamsa *et al.* 1999) activities. Literature reveals that fruits of *Berberis* spp. possess higher levels of total polyphenols, catechins and ascorbic acid (Pal *et al.* 2013), significant presence of flavonoid and polyphenols (Chandra *et al.* 2011) and alkaloids (Kamal *et al.* 2011). However, Nepalese species of *Berberis* are not well studied from these perspectives. Therefore, the present study focuses on phytochemical characterization of *Berberis* spp. of Nepal to substantiate their use as alternative food source. More specifically, the aims of the study are to quantify the antioxidant potential and antibacterial activities of the fruit extracts of four taxa of *Berberis* (*B. angulosa* var. *angulosa*, *B. angulosa* var. *fasciculata*, *B. aristata* and *B. asiatica*) and to correlate the antioxidant potential with various phytochemicals present in the extracts.

Materials and Methods

PLANT MATERIALS

Fresh fruits of four taxa of *Berberis* were collected from their wild habitats in Nepal. They were then carefully purged of any branches, thorns, leaves, mud, seeds and other waste...
substances and were air dried at 30–35°C. The voucher specimen of each taxon was collected and later deposited at the Tribhuvan University Central Herbarium (TUCH).

**PREPARATION OF FRUIT EXTRACTS**

The dried fruits were carefully excised to remove seeds and pulp was then ground to fine powder using an electric blender. Ten grams of powdered pulps were then extracted with 100 ml of methanol (Thermo Fisher Scientific, India) by using ultrasonic wave at 30 W in UC-7240 BDT sonicator (EchromeTech, Taiwan). The extracts were separately evaporated to dryness under reduced pressure. The dried extracts were then used for experiments.

**TOTAL POLYPHENOL CONTENT DETERMINATION**

Total polyphenol content was determined by folin-ciocalteu method (Ainsworth and Gillespie 2007) with slight modification. One milliliter of 1:10 dilution of Phenol Ciocalteu reagent (Thermo Fisher Scientific, India) was mixed with 100 µl of plant extract (2.5 mg/ml) and 800 µl of 1 M aqueous Na₂CO₃ (Merk India Ltd, Mumbai) solution. The reaction mixture was allowed to stand for 15 minutes at room temperature and the mixture was then subjected to absorbance measurement at 765 nm in spectrophotometer (CT8600, EChrome Tech, Taiwan). The blank was prepared in the same manner but using 100 µl pure methanol in place of fruit extracts. Gallic acid solution in methanol and water (50:50 v/v) in the concentration range 25 to 250 µg/ml was used as standard. The total phenolic content was measured as gallic acid equivalent (GAE) per gram of dry mass (mg GAE/gm).

**TOTAL FLAVONOID CONTENT DETERMINATION**

Total flavonoid content was estimated by aluminium chloride colorimetric method as per Roy et al. (2011). Standard quercetin (Sigma Aldrich, Germany) in the range of 10 to 100 µg/ml was prepared in methanol. Similarly, the fruit extracts were prepared in methanol at a concentration of 10 mg/ml. Two hundred fifty µl of each of fruit extracts and quercetin standards of different concentration were taken in separate test tubes and then mixed with 50 µl of 10% AlCl₃ (Thermo Fisher Scientific, India), 50 µl of 1 M potassium acetate (Thermo Fisher Scientific, India), and 1.4 ml of distilled water. The mixture was well shaken and left for 30 minutes at room temperature. The mixture was then subjected to absorbance measurement at 415 nm in spectrophotometer (CT8600, EChrome Tech, Taiwan). The blank was prepared in the same manner but using pure methanol in place of plant extracts and standard quercetin. The total flavonoid content was expressed as milligrams of quercetin equivalent per gram of dry mass (mg QE/g).

**DETERMINATION OF ANTIOXIDANT ACTIVITY**

Antioxidant activity of fruit extracts was carried out by using 1, 1-Diphenyl-2-picrylhydrazyl (DPPH) following the protocol of Singh et al. (2002) with slight modification. Different concentrations of fruit extracts and standard ascorbic acid in the range of 10 to 100 µg/ml were prepared in methanol. One milliliter of each sample (extract or ascorbic acid of different concentrations) was taken and separately mixed with 1 ml of 0.2 M DPPH in 2 ml polypropylene tubes with proper shaking. The tubes were allowed to stand in dark for 30 minutes at room temperature. The control was prepared in the same manner but contained pure methanol instead of fruit extracts or ascorbic acid. The absorbance was measured at 517 nm in UV-Visible Spectrophotometer (CT8600, EChrome Tech, Taiwan) using methanol as blank. The inhibitory percentage of DPPH (% radical scavenging activity) was calculated as:

\[
\% \text{ Radical scavenging activity} = 100 \times \frac{\text{Control Absorbance} - \text{Sample Absorbance}}{\text{Control Absorbance}}
\]

**ANTIBACTERIAL ACTIVITIES**

Antibacterial activity of fruit extracts was determined by using Agar well diffusion method as described in Perez et al. (1990). Six wells were prepared on the solid Mueller Hinton Agar (Himedia Ltd., Mumbai) media with the help of sterile cork borer of 5 mm diameter and labeled properly with the permanent marker pen. Five different concentrations (200 mg/ml, 150 mg/ml, 100 mg/ml, 50 mg/ml and 0 mg/ml) of the fruit extracts were prepared in DMSO. Sterile filter paper discs were placed inside the agar wells except one. With the help of sterile micropipette, 25 µl of each individual fruit extract was poured in the above prepared well. The gentamycin discs containing 10 µg of antibiotics were taken as the positive control. The plates were then scrubbed with cotton swab containing the inoculums of either of the bacterial strains (Escherichia coli or Staphylococcus aureus) to make a confluent lawn on the media surface. The plates were incubated overnight at 37°C and the zone of inhibition was observed and noted for individual fruit extracts of individual bacteria for different concentration for further analysis.

**STATISTICAL ANALYSIS**

All the experiments were performed in triplicates for each sample and values were reported as mean ± SD. One-way analysis of variance was used to find out the statistical significance of the differences in mean values of different parameters. All the statistical analyses were done using Microsoft Excel 2010.
Results

TOTAL PHENOLIC CONTENT

The total phenolic content of fruit extracts of different taxa of Berberis is shown in Figure 1. The highest total phenolic content (58.07 ± 1.44 mg GAE/g) was found in B. angulosa var. fasciculata while the lowest content (46.47 ± 0.50 mg GAE/g) was found in B. aristata. The total phenolic content in other species had values intermediate between these two extremes. The differences in mean values of total phenolic content in fruit extracts of different taxa of Berberis were statistically significant (P≤0.05).

TOTAL FLAVONOID CONTENT

The total flavonoid content of fruit extracts of different taxa of Berberis is shown in Figure 2. The highest total flavonoid content (27.52 ± 0.56 mg QE/g) was found in B. aristata while the lowest content (26.16 ± 0.28 mg QE/g) was found in B. angulosa var. fasciculata. The total flavonoid content in fruit extracts of other taxa had values intermediate between these two extremes. The differences in mean values of total flavonoid content in fruit extracts of different taxa of Berberis were statistically insignificant (P≥0.05).

RADICAL SCAVENGING ACTIVITY OF FRUIT EXTRACTS

The antioxidant activity of fruit extracts of different taxa of Berberis in terms of IC_{50} value of DPPH radical scavenging activity is shown in Figure 3. The fruit extracts of all taxa studied had IC_{50} values much higher than that of ascorbic acid. Among the plant extracts, the lowest (29.15 ± 2.01 µg/ml) and the highest (90.73 ± 1.91 µg/ml) IC_{50} value was observed for B. angulosa var. fasciculata and B. asiatica, respectively. The differences in mean values of IC_{50} in fruit extracts of different taxa were statistically significant (P≤0.05). The IC_{50} value of fruit extracts of different taxa of Berberis showed negative correlation with total phenolic content and positive correlation with total flavonoid content (Figure 4).

**Figure 2.** Total flavonoid content (TFC) of fruit extracts of different taxa of Berberis (BAA – B. angulosa var. angulosa, BAF – B. angulosa var. fasciculata, BAR – B. aristata, BAS – B. asiatica).
Antibacterial Activity

The fruit extracts of different taxa of *Berberis* were found to exhibit very weak antibacterial activity against both the bacterial strains tested even at a concentration of 5 mg per disc (i.e., 500 times the concentration of positive control, gentamicin). Fruit extracts of *B. angulosa* var. *angulosa*, *B. angulosa* var. *fasciculata* and *B. aristata* showed antibacterial activity against both bacterial strains at high concentration of the extract. The effects were higher against *S. aureus* compared to *E. coli*. The extracts of *B. asiatica* did not show antibacterial activity at any tested concentration (Table 1).

Discussion

Wild edible fruits are considered good sources of phenolic compounds, including polyphenols. The main polyphenol classes of compounds in berries are flavonoids (anthocyanins, flavonols and flavanols), condensed and hydrolyzable tannins, stilbenoids (resveratrol), and phenolic acids (Seeram 2008).

Phenolic compounds have a determinant role in taste formation and they contribute to astringency and bitterness. Phenolics are among the widely available chemicals in fruits and particularly known for their preventive activity against reactive oxygen species and free radicals (Saini et al. 2014).

The phenolic content reported in fruit extracts of different species of *Berberis* are quite variable and lie in the range of 280 mg GAE/g fruit extract in *B. vulgaris* (Mottleb et al. 2005) to 6.7 mg GAE/g in *B. asiatica* (Chandra et al. 2011). The range of total phenolic content in the fruit extracts of different taxa of *Berberis* selected in present study are much higher than the values reported by Chandra et al. (2011) and lower than that reported by Mottleb et al. (2005). The differences in the values of total phenolic content can be attributed to the differences in species, extraction procedure, extraction medium and quantification technique.

Flavonoids are one of the phenolic compounds that account for the antioxidant property of plant extracts, including

those of fruits. Anthocyanins are the most common flavonoids in fruits and are responsible for blue red or violet coloration in berries (Yao et al. 2004). Flavonoids have received considerable attention because of their antioxidant activity as shown in the present study make the fruit extracts of different taxa of Berberis species. Berberine is implicated in a number of medicinal applications, like antioxidant, antimicrobial, antidiabetic, hepatoprotective and antihyperglycemic activities (Sofflar et al. 2001; Semwal et al. 2009; Singh and Kakkar 2009; Koncic et al. 2010; Tiwari and Khosa 2010). Berberine content is reported to be higher in roots than in stem and leaves (Andola 2012). Beberine has also been reported to be present, though to a lesser extent, in fruit extracts of B. aristata and B. asiatica (Kamal et al. 2011; Chandra et al. 2011).

The presence of rich amount of phenolics, including flavonoids in the fruit extracts of Berberis and their good antioxidant activity as shown in the present study make the Berberis fruits an ideal source of locally available natural antioxidants which can be used for improving the health conditions of rural people. The weak antibacterial activity of fruit extracts substantiates the earlier findings and supports the use of these wild edible fruits, especially those of B. asiatica for human consumption even in relatively large quantities without having any negative impact on beneficial microflora inhabiting the human gut.
