Abstract
The leaves of Ocimum gratissimum having some ethno-medicinal applications were investigated. The phytochemical screening of the leaves using Standard Methods and further analysis with HPLC revealed the presence of tannins, saponins, flavonoids, alkaloids, phlobatans, terpenoids, steroids and cardiac glycosides. The elemental analysis was carried out using Atomic Absorption Spectrophotometer (AAS). The result revealed the presence of Na (0.311±0.049), Ca (0.138 ±0.111), Mg (1.712 ± 0.537), K (0.261± 0.077), Mn (0.457±0.107, Pb (0.005 ± 0.002), Zn (0.200 ±0.06), Cu (0.803±0.818), N (0.286± 0.052), and Fe (0.312 ± 0.067). Cd and Cr were not detected in the samples. This investigation suggested that Ocimum gratissimum leaves are rich in phytochemical constituents which contributed to its medicinal uses. The leaves of Ocimum gratissimum can be said to contain some components of medical value since the chemical components elaborated by it are active principles (alkaloid, steroids and glycosides). Ocimum gratissimum also contain most of the essentials elements indicating its nutritive values and less toxic as Cd and Cr were not detected in the leaf.

Keywords: Ocimum gratissimum; Phytochemical screening; elemental analysis.

Introduction
Plants are richest resources of drugs in the traditional and modern systems of medicine, nutraceuticals, food supplements, pharmaceutical intermediates and chemical entities for synthetic drugs (Hammer et al., 1999). The use of plants and plants products as medicines could be traced back to the beginning of human civilization. Medicinal plants are of great importance to the health of individual and the communities. The medicinal values of some plants lie in some chemical substances that produce definite physiological actions in the human body. The most important of these bioactive constituents are alkaloids, tannins, flavonoids and phenolic compounds. Many of these indigenous medicinal plants are used as spices and food plants (Okwu, 1999 & 2001). An Ethnobotanical and ubiquitous plant serves as rich resources of natural drugs for research and development (Kong et al., 2008).

Medicinal plants based drugs owe the advantage of being simple, effective and exhibit broad spectrum activity. The revival of interest in the use and importance of African medical plants by WHO and many developing countries has led to intensified efforts on the documentation of ethnomedical data of medicinal efforts. This is because most traditional healers keep no records and their information is passed on mainly verbally from generation to generation. Researchers are increasingly turning their attention to natural products looking for new leads to develop better drugs against cancer, as well as viral and microbial infections. The phytochemical evaluation of Ocimum gratissimum shows that it is rich in alkaloid, tannins, phytates, flavonoids and Oligosaccharides (Ijeh, et al., 2004). In the coastal area of Nigeria, the plant Ocimum gratissimum is used in the treatment of epilepsy, high fever and diarrhea (Sofowora, 1993; Ladipo et al., 2010).

The plant Ocimum gratissimum is one of those plants widely known and used for both medicinal and nutritional purposes. It is a perennial plant that is widely distributed in the tropics of Africa and Asia. It belongs to the Family Labiatae and it is the most abundant of the genus Ocimum. The common names of the plant are Basil Fever plant or Tea bush and vernacular names include Daidoya tagida (Hausa), Nichonwu (Igbo), Tanmotswangiwawagi (Nupe) and Efinrin (Yoruba) (Abdullahi et al., 2003; Idris et al., 2011).

It is woody at the base and has an average height of 1-3 meters. The leaves are broad and narrowly ovate, usually 5-13cm long and 3-9cm wide. It is a scented shrub with lime-green leaves (USDA, 2008). The plant is consumed by the Igboas as a leafy vegetables and the nutritional importance of this plant center on its usefulness as a seasoning because of its aromatic flavor. It is also used by the Igboas in the management of the baby’s cord. It is believed to keep the baby’s cord and wound surface sterile. It is used in the
treatment of fungal infections, fever, cold and catarrh. *Ocimum gratissimum* is used through West Africa as anti-malarial and anti-convulsant. The crushed leaf juice is used in the treatment of convulsion, stomach pain and catarrh. Oil from the leaves have been found to possess antiseptics, antibacterial and antifungal activities (Edeoga and Eriata, 2001; Sofowara 1984).

The findings of Silva, *et al* (2005) show that the extracts of *Ocimum gratissimum* are active in vitro against human pathogenic dermatophytes. The aim of this present work therefore is to carry out phytochemical screening and elemental analysis of the sample.

**Materials and Methods**

**Sample Collection**
The plant leaves of *Ocimum gratissimum* (scent leaf) was collected from a farm at Mubi in Mubi South local government area of Adamawa State, Nigeria. The plant was identified in the Department of Biological sciences, Adamawa State University, Mubi, Nigeria. The residual moisture was evaporated at room temperature thereafter the fresh leaves samples were allowed to dry completely for two weeks at a room temperature before using them for this study.

**Sample Preparations and Extraction**
The air-dried plant sample was ground using pestle and mortar into a powdered form, sieved through 2mm mesh sieve and stored in plastic container. The powdered sample was used for both phytochemical and elemental analysis.

An aliquot of 100g of the plant sample was added into a 100ml of distilled water and 70% w/v ethanol, this gives the water and ethanol extract of 100mg/ml, the crude extraction was done at a room temperature. 100g of the ground sample was soaked in 1000ml of distilled water and ethanol for 24hours at room temperature in order to obtain water and ethanol extract. Muslin cloth was used to filter the plant leaves residues and the filtrate obtained was further purified by filtration through Whatman No 1 filter paper under aseptic condition. The filtrate collected was then concentrated by using rotary evaporator. The extract was then collected in fresh sterile universal bottles and stored in the refrigerator at 4°C until when required for use (Atata *et al* 2003; Ladipo *et al*., 2010).

**Sample Preparation for Elemental Analysis**
5g of the dried powdered sample was weighed into a crucible and gently heated over a hot plate until it is charred. The charred sample with the crucible was transferred into a muffle furnace and the temperature of the furnace was raised to about 550°C, the sample was allowed to stay in the furnace until grayish white ash was obtained. It was allowed to cool at room temperature and then transferred inside desiccators. 5cm³ of Conc. HCl/HNO₃ in the ratio of 1:3 was added into the ash and heated on a hot plate for 5minutes inside a fume cupboard until it reduces to 2cm³. The mixture was allowed to cool, then transferred into a beaker and the crucible was washed several times with distilled water. The mixture was filtered into a 100cm³ volumetric flask using No. 540 whatman filter paper and made up to the mark (AOAC, 2000).

**Phytochemical Analysis**
Phytochemical screening was carried out using standard procedures to identify the constituents as describe by Sofowara (1993); Okwu, (2005) and Ladipo, (2010).

**Qualitative Analysis of the Constituents**

**Test for Tannins**
0.5g of the dried powdered sample was boiled in 20cm³ of water in a test tube and was filtered. A few drops of 0.1% ferric chloride was added for observation of brownish green or a blue black colouration.

**Test for Phlobatanin**
Aqueous extract of the plant sample was boiled with 1% aqueous hydrochloric acid and deposition of a red precipitate was seen as an evidence for the presence of phlobatanins.

**Test for Saponins**
2g of the powdered sample was boiled in 20cm³ of distilled water in a water bath and filtered. 10cm³ of the filtrate was mixed with 5cm³ of distilled water and was shaken vigorously for a stable persistent froth to be formed. The frothing was mixed with 3 drops of olive oil, and was shaken vigorously and then observed for the formation of emulsion.

**Test for Flavonoids**
5cm³ of 10% diluted ammonia solution was added to a portion of the aqueous filtrate of the plant extract, and then followed by addition of concentrated H₂SO₄. The observation of a yellow colouration in the extract indicated the presence of flavonoids.

**Test for Cardiac Glycosides**
5cm³ of the extract was treated with 2cm³ of glacial acetic acid containing 1 drop of ferric chloride solution (0.1%) was underlayed with 1cm³ of concentrated H₂SO₄. A brown ring of the interface was indicated by a deoxysugar characteristic of cardenolides. The violet ring did not appear below the brown ring, while in the acetic layer, a greenish ring was not formed throughout thin layer.

**Test for Terpenoids**
5cm³ of the extract was mixed in 2cm³ chloroform and 3cm³ conc. H₂SO₄ was added, to form a layer. A reddish brown colouration of the interface was formed to show the positive result for the presence of terpenoids.

**Test for Steroids**
2cm³ of acetic anhydride was added to 0.5g ethanolic extract of the sample with 2cm³ of H₂SO₄. The colour does
not change from violet to green to indicate the presence of steroids.

**Sample preparation for (HPLC)**

5g of prepared sample was placed into a 25cm³ standard volumetric flask and make up to mark with buffer diluents. The solution was reflux, shaken, centrifuged and decanted. The filtrate was filtered using the HPLC grade filter paper.

**Results and Discussion**

The result of phytochemical screening Table 1 of *Ocimum gratissimum* showed that the plant leaves contains tannins, flavonoids, terpenoids alkaloids plobatannins, tannins saponins, steroids and glycosides. Further analysis of the phytochemicals constituents with HPLC ascertains that *Ocimum gratissimum* contains all the necessary phytochemical constituents. These metabolites are known to have varied pharmacological actions in man and animals, the presence of these metabolites suggest great potentials of the plants as a source of useful phytomedicines. The phytochemicals are naturally occurring chemicals in plants which serve as medicinal for the protection of human disease; the phytochemical are non nutritive plants chemical that have protection or disease preventive properties (Cheng et al., 2002).

WHO – World Health Organisation

The concentration of sodium in the plant is 0.311 ± 0.04mg/kg. Sodium has an important role in maintaining the water balance within cells and in the function of both nerve impulse and muscles. The sodium also helps in maintaining a normal heart rhythm and is sometimes given intravenously to reduce the chance of atrial fibrillation and cardiac arrhythmia (Holleyman et al., 1988).

Alkaloids are also considered as nitrogenous bases that occur in plants, many of them have marked physiological effects on humans. Some alkaloids used as medicine are morphine, caffeine and coffee; in which caffeine in tea and coffee is alkaloids that stimulate the nervous system (Stanley et al., 2007). The presence of alkaloids suggests that it has potential antimicrobial activity on microorganisms. Some plants that posse alkaloids are known for decreasing blood pressure and balancing the nervous system in case of mental illness. Alkaloids are known to possess’ anti-malaria property; hence the plants may be a good source of anti-malaria for which it is traditionally used (Stanley et al., 2007).

Flavonoids are polyphenolic compound that contribute to many other colours found in nature particularly the yellow and orange of petal, they have been reported to have antiviral and antialleptic activities. Presence of flavonoids might be responsible for its use as anti-inflammatory effects on both acute and chronic inflammation (Boham and Kocipai, 1994). The presence of saponins serves as potential activity of an antimicrobial agent. The presence serves as an indicator towards possible antibacterial activity. Saponins are a class of natural products involving and can be used to enhance penetration of micro molecules such as protein through cell membrane.

**Mineral content**

The result of the mineral composition of the leaves was presented in Table 2. The result revealed the presence of the essential elements such as Mg, K, Cu, Zn, N, Fe, Na and Ca; which indicates the medicinal values of the plant. Different combination of these elements in the medicinal plant helps to cure the ailments. From the results of the investigation carried out, magnesium was the most abundant elements with the concentration of 1.712 ± 0.537mg/kg. Magnesium helps in maintaining a normal heart rhythm and is sometimes given intravenously to reduce the chance of atrial fibrillation and cardiac arrhythmia (Holleyman et al., 1988).
and maintaining strong bones and teeth, large part of human blood and extracellular fluids. Approximately 99 percent of the body’s calcium is stored in the bones and teeth (Hollemann et al., 1988). The studied plant of O. gratissimum is essential in building up the level of calcium in the body.

The concentration of iron in the studied plant leaf of O. gratissimum is 90.312 ± 0.067mg/kg). The presence of iron shows that the plant is essential for red blood cell production and oxygen transport in the body as supported by the work of (Bahl and Bahl, 2006).

Lead (Pb) was present at a very low concentration of (0.005 ±0.0016mg/kg). Lead occurs naturally in the environment. Everyone may be exposed to trace amounts of leads through air, soil, household dust, food, drinking water and various consumer products (Shivery and Sofora, 2009).

The presence of Cu, Mn, and Zn indicates that the plant is essential for: immune function, protein synthesis, blood clothing, Hormones, formation of hemoglobin and for secretion and potentiating insulin action, this has been also reported by (Bahl and Bahl, 2006), and their concentrations in the plant leaf range as Cu (0.80 ±0.818mg/kg), Mn (0.46 ±0.107mg/kg) and Zn (0.20 ±0.006mg/kg) respectively. Copper is an essential element in the human body and exist as an integral part of copper proteins cerulosmin, which is concern with the release of iron from the cells into the plasma and is involved in energy metabolism (Bahl and Bahl, 2006).

Chromium in trivalent state is an essential trace element that potentiates insulin action and thus influences carbohydrate, lipid and protein (Shivery and Sofora, 2009). Chromium was not detected in plant leaf of O. gratissimum.

Cadmium was also not detected in the sample, cadmium causes kidney and liver problem including heart, brain and eyes problem on longer time of its accumulation (WHO, 1995). Ocimum gratissimum leaf is safe for consumption since these toxic elements were noted detected.

Conclusion
The phytochemical and elemental component of the leaves of Ocimum gratissimum was analysed. The result indicated that the leaf of the plant contains some major bioactive compounds that can inhibit the growth of microorganism, thereby proving it as an effective potentials source of antibiotic. However, the result revealed that the plant leaf contains saponins, tannins and alkaloids which help to inhibits bacterial growth. The plant extract might also be a potential source for drugs formulation as the plant leaves are used traditionally for curring of many infectious diseases. This study also justified that this plant leaf has significant nutritive values which are essential nutrients. Thereby, the plant leaf is good for consumption.
