Abstract: In this paper, we briefly discuss the theory of weights and then define A_1 and A_p weight functions. Finally we prove some of the properties of A_p weight function.

Key words: A_1 weight function, Maximal functions, A_p weight function.

1. Introduction

The theory of weights play an important role in various fields such as extrapolation theory, vector-valued inequalities and estimates for certain class of non linear differential equation. Moreover, they are very useful in the study of boundary value problems for Laplace’s equation in Lipschitz domains. In 1970, Muckenhoupt characterized positive functions w for which the Hardy-Littlewood maximal operator M maps L^p(R^n, w(x)dx) to itself. Muckenhoupt's characterization actually gave the better understanding of theory of weighted inequalities which then led to the introduction of A_p class and consequently the development of weighted inequalities.

2. Definitions

Definition: A locally integrable function on R^n that takes values in the interval (0,∞) almost everywhere is called a weight. So by definition a weight function can be zero or infinity only on a set whose Lebesgue measure is zero.

We use the notation w(E) = \int_E w(x)dx to denote the w-measure of the set E and we reserve the notation L^p(R^n,w) or L^p(w) for the weighted L^p spaces. We note that w(E)<∞ for all sets E contained in some ball since the weights are locally integrable functions.

Definition: The uncentered Hardy-Littlewood maximal operators on R^n over balls B is defined as

\[ M(f)(x) = \sup_{x \in B} \text{Avg}_B |f| = \sup_{x \in B} \frac{1}{|B|} \int_B |f(y)|dy. \]

Similarly the uncentered Hardy-Littlewood maximal operators on R^n over cubes Q is defined as
Some Properties of A P Weight Function

Abstract: In this paper, we briefly discuss the theory of weights and then define A_1 and A_p weight functions. Finally we prove some of the properties of A_p weight function.

Key words: A_1 weight function, Maximal functions, A_p weight function.

1. Introduction

The theory of weights play an important role in various fields such as extrapolation theory, vector-valued inequalities and estimates for certain class of non linear differential equation. Moreover, they are very useful in the study of boundary value problems for Laplace’s equation in Lipschitz domains. In 1970, Muckenhoupt characterized positive functions w for which the Hardy-Littlewood maximal operator M maps L_p (R^n, w(x)dx) to itself. Muckenhoupt’s characterization actually gave the better understanding of theory of weighted inequalities which then led to the introduction of A_p class and consequently the development of weighted inequalities.

2. Definitions

Definition: A locally integrable function on R^n that takes values in the interval (0, ∞) almost everywhere is called a weight. So by definition a weight function can be zero or infinity only on a set whose Lebesgue measure is zero.

We use the notation \( \mathcal{W} = \int_E w \) to denote the w-measure of the set E and we reserve the notation \( L_p (R^n, w) \) or \( L_p (w) \) for the weighted L_p spaces. We note that \( w(E) < \infty \) for all sets E contained in some ball since the weights are locally integrable functions.

Definition: The uncentered Hardy-Littlewood maximal operator \( M \) on R^n over balls B is defined as

\[
M(w)(x) = \sup_{x \in B} \text{Avg}_{|B|} |w(t)| dt.
\]

Similarly the uncentered Hardy-Littlewood maximal operators on R^n over cubes Q is defined as

\[
M(w)(x) = \sup_{x \in Q} \text{Avg}_{|Q|} |w(t)| dt.
\]

In each of the definition above, the suprema are taken over all balls B and cubes Q containing the point x. H-L maximal functions are widely used in Harmonic Analysis. For the details about the H-L maximal operators, see [2].

Definition: A function \( w(x) \geq 0 \) is called an A_1 weight if there is a constant \( C_1 > 0 \) such that

\[
M(w)(x) \leq C_1 w(x)
\]

where \( M(w) \) is uncentered Hardy-Littlewood Maximal function given by

\[
M(w)(x) = \sup_{x \in B} \text{Avg}_{|B|} |w(t)| dt.
\]

If w is an A_1 weight, then the quantity (which is finite) given by

\[
[w]_{A_1} = \sup_{Q \text{ cubes in } R^n} \left( \frac{1}{|Q|} \int_Q |w(t)| dt \right) \left\| w^{-1} \right\|_{L^\infty(Q)}
\]

is called the A_1 characteristic constant of w.

Definition: Let 1 < p < \infty. A weight w is said to be of class A_p if \( [w]_{A_p} \) is finite where \( [w]_{A_p} \) is defined as

\[
[w]_{A_p} = \sup_{Q \text{ cubes in } R^n} \left( \frac{1}{|Q|} \int_Q |w(x)| dx \right) \left( \frac{1}{|Q|} \int_Q |w(x)|^{\frac{1}{p-1}} dx \right)^{p-1}.
\]

We remark that in the above definition of A_1 and A_p one can also use set of all balls in R^n instead of all cubes in R^n.

3. Properties

Now we state and prove some of the properties of A_p weight functions:

Property 1: Let k be a nonnegative measurable function such that k, k^{-1} are in L_\infty(R^n). Then if w is an A_p for some 1 \leq p < \infty, then kw is also an A_p weight function.

Proof: For kw to be an A_p weight function, we must show (as described in definition) \( [kw]_{A_p} < \infty \), where \( [kw]_{A_p} \) is given by;

\[
[kw]_{A_p} = \sup_{Q \text{ cubes in } R^n} \left( \frac{1}{|Q|} \int_Q |kw(x)| dx \right) \left( \frac{1}{|Q|} \int_Q |kw(x)|^{\frac{1}{p-1}} dx \right)^{p-1}.
\]

Note that k and k^{-1} are in L_\infty(R^n), so we have \( ||k||_{L_\infty} < \infty \) and \( ||k^{-1}||_{L_\infty} < \infty \). Using this together with nonnegativity of k and k^{-1}, we have

\[
\left( \frac{1}{|Q|} \int_Q |k(x)| dx \right) \left( \frac{1}{|Q|} \int_Q |k(x)|^{\frac{1}{p-1}} dx \right)^{p-1} = \left( \frac{1}{|Q|} \int_Q (k(x)) dx \right) \left( \frac{1}{|Q|} \int_Q (k(x))^{\frac{1}{p-1}} dx \right)^{p-1}
\]
Now taking supremum over all cubes \( Q \) in \( \mathbb{R}^n \), we get \( [kw]_{A_p} < \infty \). This shows that \( kw \) is an \( A_p \) weight.

**Property 2:** Suppose that \( w \) is in \( A_p \) for some \( p \in [1, \infty] \) and \( 0 < \delta < 1 \). Then \( w^\delta \) belongs to \( A_q \) where \( q = \delta p + 1 - \delta \). Moreover, \( [w^\delta]_{A_p} \leq [w]_{A_p}^{\delta} \).

**Proof:** We have

\[
I_B(w) = \left( \frac{1}{|B|} \int_B w^\delta \right) \left( \frac{1}{|B|} \int_B w^{\delta(1-p)} dx \right)^{\frac{1}{p-1}}
\]

\[
I_B(w) = \left( \frac{1}{|B|} \int_B w^\delta \right) \left( \frac{1}{|B|} \int_B w^{1-q} dx \right)^{\frac{\delta}{q-1}}
\]

Let us denote \( f(q) = \left( \frac{1}{|Q|} \int_Q u^q dx \right)^{\frac{1}{q}} \), \( u \geq 0, q > 0 \). Next we claim that \( f(q) \) is an increasing function of \( q \). For this we note that by Holder's inequality,

\[
\int_Q u^q dx \leq \left( \frac{1}{|Q|} \int_Q u^{qk} dx \right)^{\frac{k}{qk}} \left( \int_Q 1^{k'} dx \right)^{\frac{k'}{k}}, \forall k > \frac{1}{k} \text{ and } \frac{1}{k} + \frac{1}{k'} = 1.
\]

Let \( q_1 > q \). Set \( k = \frac{q_1}{q} > 1 \). One has

\[
\int_Q u^q dx \leq \left( \int_Q u^{q_1} dx \right)^{\frac{q}{q_1}} |Q|^{1-\frac{q}{q_1}}.
\]

Taking q-th root both sides, we have

\[
f(q) = \left( \frac{1}{|Q|} \int_Q u^q dx \right)^{\frac{1}{q}} \leq \left( \frac{1}{|Q|} \int_Q u^{q_1} dx \right)^{\frac{1}{q_1}} = f(q_1), \forall q > q_1. \text{ This proves the claim that } f(q) \text{ is an increasing function of } q. \text{ Using the claim we have,}
\]

\[
\left( \frac{1}{|B|} \int_B w^\delta \right)^{\frac{\delta}{q}} \leq \frac{1}{|B|} \int_B w, \forall 0 < \delta < 1
\]

From (1) and (2), we have,
\[ I_B(w) \leq \left( \frac{1}{|B|} \int_B w \right)^{\delta} \left( \frac{1}{|B|} \int_B w^{(1-q)} \, dx \right)^{\frac{\delta}{q-1}} \leq [w]_{A_p}^{\delta}. \]

Thus, \[ [w^{\delta}]_{A_p} = \sup_{B \subset \mathbb{R}^n} I_B(w) \leq [w]_{A_p}. \]

**Property 3:** Show that if the \( A_p \) characteristics constants of a weight \( w \) are uniformly bounded for all \( p > 1 \), then \( w \) is in \( A_1 \).

Proof: As given, \([w]_{A_p}\) are uniformly bounded for all \( p > 1 \). Thus there exists a constant \( M < \infty \) such that \([w]_{A_p} \leq M \) for all \( p > 1 \). For a fixed \( p > 1 \), by definition we know that,

\[ [w]_{A_p} = \sup_{q \text{ balls in } \mathbb{R}^n} \left( \frac{1}{|B|} \int_B w \, dx \right) \left( \frac{1}{|B|} \int_B \frac{1}{w^{p-1}} \, dx \right)^{p-1}. \]

So, \( \left( \frac{1}{|B|} \int_B w \, dx \right) \left( \frac{1}{|B|} \int_B \frac{1}{w^{p-1}} \, dx \right)^{p-1} \leq M \) for all balls \( B \). Specifically, when \( p \to 1 \), the inequality holds. That is,

\[ \lim_{p \to 1^+} \left( \frac{1}{|B|} \int_B w(x) \, dx \right) \left( \frac{1}{|B|} \int_B \frac{1}{w^{p-1}} \, dx \right)^{p-1} = \left( \frac{1}{|B|} \int_B w(x) \, dx \right) \|w^{-1}\|_{L^\infty(B)} \leq M. \]

This is true because

\[ \lim_{p \to 1^+} \left( \frac{1}{|B|} \int_B \frac{1}{w^{p-1}} \, dx \right)^{p-1} = \lim_{p \to 1^+} \left( \left( \frac{1}{|B|} \right)^{p-1} \|w^{-1}\|_{L^{p-1}(B)}^{p-1} \right) = \lim_{p \to 1^+} \|w^{-1}\|_{L^{p-1}(B)}^{p-1}. \]

and notice the fact that for \( 0 < q < p \leq \infty \), \( \|w^{-1}\|_{L^q(B)} \leq \|w^{-1}\|_{L^p(B)} \).

Now taking supremum over all balls \( B \), we get,

\[ [w]_{A_1} = \sup_B \left( \frac{1}{|B|} \int_B w(x) \, dx \right) \|w^{-1}\|_{L^\infty(B)} \leq M < \infty. \]

Hence \( w \) is in \( A_1 \) by definition.

There are other properties of \( A_p \) which can be proved using the elementary analysis tools. For more properties, we refer [1, 2, 3].

### 4. Conclusion

We studied \( A_1 \) and \( A_p \) weight functions and we proved some important properties of these weight function using the elementary analysis tools.
