Keywords:
Cervical cancer; Pap smear; Screening; Bethesda system; Intraepithelial lesion; Malignancy.

ABSTRACT

Background: Cervical cancer is a leading cause of mortality and morbidity among women worldwide and most common gynaecological cancer in developing countries. Papanicolaou smear is a simple and cost effective screening test for cervical cancer. The aim of this study is to evaluate and interpret the cervical pap smear cytology in a tertiary hospital. The interpretation and reporting of the pap smear is based on 2001 Bethesda system.

Materials and methods: This is a prospective study conducted in a tertiary hospital, Nepal Medical College over a period of two and a half years (January 2013 to June 2015). All cervical pap smears received in the department of Pathology in the study period were included.

Results: A total of 4160 cervical pap smears were reported in the study period. Majority of the cases were Negative for Intraepithelial lesion or malignancy (87.9%). Bacterial vaginosis, atrophy and reactive cellular changes associated with inflammation were seen in 5.3%, 2.4% and 1.5% cases respectively. Epithelial cell abnormalities (0.5%) include Atypical squamous cells of undetermined significance, Low grade squamous intraepithelial lesion and High grade intraepithelial lesion. 88% of Low grade squamous intraepithelial lesion was seen in reproductive age group (20-45 years).

Conclusion: Cervical cancer is the most common gynaecological cancer in the developing countries. Pap smear is the simple and cost effective screening tool to detect pre invasive cervical epithelial lesions.

INTRODUCTION

Cervical cancer is the most common gynaecological cancer leading to death in developing countries like Nepal.1,2 The World Health Organization (WHO) Information Centre on HPV (Human Papilloma Virus) and Cervical Cancer states the incidence of cervical cancer in Nepal is 24.3 per 100,000 making Nepal a country with one of the highest rates of cervical cancer in the world. Over 2100 cases of cervical cancer are reported in Nepal each year, with a case-fatality rate of over 50%.3

In developing countries, the higher prevalence of cervical cancer is due to ineffective screening programmes. Pap smear is a simple, convenient, cost effective and reliable test for easy screening of cervical lesions. Since its introduction there has been a dramatic reduction in the incidence and mortality of invasive cervical cancer worldwide.4-6

The 2001 Bethesda system terminology reflects important
advances in biological understanding of cervical neoplasia
and cervical screening technology and is most widely used
system for describing pap smear result.\textsuperscript{7-9}

This study is done to evaluate the pattern of cervical pap
smear cytology and find out the incidence of epithelial cell
abnormalities.

**MATERIALS AND METHODS**

This is a prospective study done in a department of Pathology
of a tertiary hospital (Nepal Medical College) for a period of
two and a half years (January 2013 to June 2015). All cervical
pap smears received in the Department of Pathology during
the study period were included. Required clinical history
of the patients was obtained from the requisition forms and
patient's file. Prior to the study, permission was obtained
from Institutional Review Committee. Proforma was filled
and data were collected. A total of 4160 cervical pap smears
were reported in the study period. After receiving the slides
fixed in 95% ethyl alcohol, it was stained by Papanicolaou
stain by cyto technicians. Slides were then mounted with
DPX (Distrene Dibutyl phthalate Xylene) and examined by
pathologists. The result of these pap smears was based on
2001 Bethesda System for Reporting Cervical Cytologic
Diagnoses (Box 1). The report given by pathologists was
based on 2001 Bethesda reporting system.

All the data were manually collected and subsequently
analyzed.

**RESULTS**

A total of 4160 pap smears were analyzed during the study
period (Table 1). The age of the patients ranged from 17 to
78 years. Majority (84.7\%) of the pap smears were form the
reproductive age group (20- 45 years). 0.6\% of pap smears
were from patients below 20 years and 0.1\% from patient
above 75 years. Cervical pap smear findings were tabulated
in Table 2.

There were 0.9\% cases of unsatisfactory smear. The most
common cause for unsatisfactory smear was obscuring
inflammation (55.3\%) where more than 75\% of epithelial
cells are obscured. 34.2\% cases showed absence of
endocervical/ transformation zone component and 10.5\%
showed obscuring blood. 87.9\% cases were Negative for
Intraepithelial Lesion or Malignancy.

Epithelial cell abnormalities were seen in 0.5\% cases which
include LSIL (0.2\%), HSIL (0.2\%) and ASCUS (0.1\%).
LSIL was most commonly seen in reproductive age group
(20- 45 years) and HSIL was most commonly seen in peri
menopausal age group (46-55 years). Atrophic and reactive
cellular changes were seen in 2.4\% and 1.5\% respectively.
Organism associated lesion like bacterial vaginosis (5.3\%)
and trichomonas vaginalis (1.5\%) were also seen in our

**DISCUSSION**

Worldwide cervical carcinoma alone is responsible for about
5\% of all cancer deaths in women.\textsuperscript{10} It has been reported
that in developing countries more than 200, 000- 300, 000
women die from cervical cancer each year. Initiation of
national screening program in the developed countries has
resulted in a marked decrease in the cervical cancer related
deaths.\textsuperscript{11} Not only in developing countries, tremendous
amount of effort is devoted to cervical cancer screening
in United States.\textsuperscript{12} The incidence of cervical cancer has
decreased more than 50\% in the past thirty years because of
widespread screening with cervical cytology.\textsuperscript{5} Considering
the efficacy of pap smear cytology in preventing cervical
cancer it is advocated that it should be initiated in all women
at the age of 21 years.\textsuperscript{8}

The age of the patient ranged from 17 to 78 years in our
study and the predominant population in the present study
was between 20- 45 years (84.7\%). This finding was similar
to studies done by Hirachand et al, Ranabhat et al, Bukhar et al and Bamanikar et al.6,13

0.6% of pap smears were from patients below 20 years and similar result (0.7%) was seen in study done in Karnataka, India.14 However in studies done in mid western part of Nepal and Bangladesh there were no cases below 20 years.5,8 Contrast to this and our study the number of cases of pap smear below 20 years was quite high (11.7%) in Pakistan.15

Getting adequate material in pap smear is difficult at times. There were 0.9% cases of unsatisfactory smear in our study and the most common cause was obscuring inflammation and absence of endocervical/ transformation zone component. Lots of variation was seen in several studies. Studies done in Kathmandu, Pakistan and India revealed 0.3%, 1.8% and 1.2% cases of unsatisfactory smear respectively.4,6,14 Few other studies showed that the incidence of unsatisfactory smear to be quite high (11.9%, 9.5%, 5.7% and 4.8%).9,11,13,16

Negative for Intraepithelial Lesion or Malignancy was seen in 87.9% cases which correlates well with study done by Bamanikar et al in a tertiary hospital (88.93%).13 In studies done by Vaghela et al and Saha et al, Negative for Intraepithelial Lesion or Malignancy were seen in 47% and 50.6% respectively.16,17

Epithelial cell abnormalities represented 0.5% cases in our study which includes LSIL, HSIL and ASCUS. Studies had shown that the prevalence of epithelial abnormalities were different in different places (1.7%, 1.8%, 10.3%, 5.6%, 1.8%, 2.0%, 1.2% and 13.6%).4,14,17,22 In a study done in the same hospital in 2010, epithelial cell abnormalities were seen in 1.1% cases.17 Since then there is decrease in epithelial cell abnormalities which could be due to inclusion of pap smear as a routine screening procedure for cervical cancer. LSIL (0.2%) seen in our study was similar to other studies (0.15%, 0.3% and 0.2%).4,5,8 Most of the cases of LSIL had mild dysplasia and morphological features consistent with HPV cytopathy. HSIL was seen in 0.2% cases in our study. Studies done in Nepal and India showed findings (0.29%, 0.7% and 0.3%) similar to our study.4,5,8 Cases of ASCUS (0.1%) was also quite comparable to other studies (0.51%, 0.23% and 0.2%).4,5,8 However in one study done in Gujarat India, the incidence of ASCUS (40.74%) was quite high.19

LSIL and HSIL were most commonly seen in reproductive (20- 45 years) age group and perimenopausal (46-55 years) age group respectively which correlates well with study done by Hirachand et al.4 Other studies revealed epithelial cell abnormalities in age group 40 years and above.5,19

Atrophic changes were seen in 2.4% cases which correlates well with studies done in Bangladesh (3.0%), India (2.2%) and Pakistan (3.1%).8,9,11 Bacterial vaginosis (5.3%) was common among the organism associated lesion in our study. Other studies revealed 5.4%, 1.6%, 7.1% and 8.8% cases of bacterial vaginosis respectively.14,16,17,22 Trichomoniasis vaginalis was seen in 1.5% cases in contrast to other studies where there were 3.2%, 0.7% and 0.6% cases.17,19,20 Reactive cellular changes (1.5%) seen in our study was associated with inflammation. Two studies done in India revealed 3.2% and 26.8% cases of reactive cellular changes.17,19 This shows that interpretation of reactive cellular changes is very subjective and hence the results are variable.

Pap smear examination should begin as soon as the female are sexually active irrespective of their age and should be practiced as a routine gynaecological screening program. Implementation of pap screening program in all parts of Nepal is necessary for early detection of cervical premalignant lesions.

CONCLUSION

Pap smear is a very effective screening tool for early detection of premalignant and malignant lesions of the cervix. The 2001 Bethesda system used for cervical cytology is a standard method and gives descriptive diagnosis that helps the gynaecologist in individual patient management. Awareness regarding the utility and importance of pap smear should be created among all the women worldwide.
