ABSTRACT

It is reported that about 1 in 11 adults have diabetes mellitus (DM) globally. A total of 415 million people have DM and an estimated 193 million people have undiagnosed DM worldwide. Where, type 2 diabetes mellitus (T2DM) accounts for around 90% of patients with DM. Yoga interventions appeared to be more effective in T2DM as compared to physical exercise interventions which may be because of various aspects of yoga other than the physical one. The yoga intervention involves subtle components such as mindfulness, relaxation, breath regulation, and notional corrections. The mechanism through which yoga works may be the down-regulation of the sympathetic nervous system and the hypothalamic-pituitary-adrenal axis which may lead to the improvement in psychological health, quality of sleep, autonomic balance, and reduction in insulin resistance. Lifestyle modification programs such as yoga interventions on a regular basis for long duration have potential to manage and cure T2DM. The government and the concerned bodies should pay attention to this area.

Key words: Diabetes Mellitus; Glycaemic Control; Lifestyle; Meditation; Yoga.

INTRODUCTION

Diabetes mellitus (DM) is a common metabolic disorder characterised by a chronic hyperglycaemic condition. DM can be diagnosed by one or more of the below criteria: HbA1c ≥ 6.5%, Fasting plasma glucose ≥ 126 mg/dL, Random plasma glucose ≥ 200 mg/dL, 2-hour plasma glucose ≥ 200 mg/dL. The autoimmune destruction of pancreatic beta cells leads to a deficiency of insulin secretion in type 1 diabetes mellitus, whereas, Type 2 diabetes mellitus (T2DM) is characterised by increased insulin resistance and impaired insulin secretion. In another language, T2DM is defined as a hyperglycaemia not caused by autoimmune destruction or other known conditions. It is reported that about 1 in 11 adults have DM globally. A total of 415 million people have DM and an estimated 193 million people have undiagnosed DM worldwide. Where, T2DM accounts for around 90% of patients with DM. The Prevalence of T2DM is increasing rapidly in Asia, where India and China are reported to be the top two epicentres. Yoga therapy is considered to be effective in improving positive health. Studies have demonstrated the effectiveness of yoga in the management of various lifestyle diseases.

The current article reviewed controlled study to investigate role of Yoga on Glycaemic Control and Other Health Parameters in Type 2 Diabetes Mellitus (T2DM)

RISK FACTORS ASSOCIATED WITH T2DM

Studies demonstrated that obesity, sedentary lifestyle, lack of exercise, poor diet habits, smoking, genetic

TREATMENT OPTIONS FOR T2DM

Biguanides (Metformin), Sulfonylureas, Meglitinides, Thiazolidinediones, Alpha-Glucosidase Inhibitors, Incretin-Based Therapies, Dipeptidyl-Peptidase IV Inhibitors, Insulin, Insulin analogues etc. are commonly adopted modern medication strategies for the management of diabetes mellitus. Where, Metformin is the first choice for the management of most of the T2DM patients, however, no any permanent cure has yet been discovered for T2DM in the mainstream medical system.

Other alternative therapies such as yoga therapy, dietary supplements, acupuncture, hydrotherapy etc. are also used for T2DM and they are less likely to have the side effects and complications. Lifestyle modification program including physical activities, healthy diet, maintaining healthy body weight, stopping smoking etc. has also been appeared to be effective strategy for the prevention and management of T2DM.

A randomised controlled trial (RCT), conducted with 3234 non-diabetic persons with elevated fasting and post-load plasma glucose concentrations, published in the New England Journal of Medicine, reported that the lifestyle intervention (healthy low-calorie low-fat diet, physical activity of moderate intensity for at least 150 minutes per week, and behaviour modification) was significantly more effective than metformin (850 mg twice daily) to prevent the incidence of T2DM. Physical exercise and healthy diet (Mediterranean diet, low-carbohydrate/ high-protein diet, vegan/vegetarian diet) both were found to be effective individually to improve glycaemic control in T2DM.

YOGA THERAPY

Yoga is not only a combination of physical postures and breath regulation, it is an art of holistic living for the integrative development of the body, mind and soul. Yoga is an ancient technique developed to unite the individual consciousness with the universal consciousness, however, several recent studies have demonstrated the vast therapeutic benefits associated with it for the management and cure of various lifestyle disorders.

Yoga, traditionally, involves eight limbs namely restraints, observances, physical postures, breath regulation, withdrawal of the senses, focused meditation, meditation, and absorption, however, the physical postures, breath regulation, and meditation have been used commonly for therapeutic purposes nowadays.

YOGA INTERVENTION FOR T2DM

Many literatures have reported the effectiveness of yoga in the prevention and treatment of many lifestyle disorders, and in the preservation of positive health. For the better management of T2DM, it is necessary to involve in yoga-based lifestyle program on regular basis for long duration. Many studies have demonstrated the effectiveness of yoga on metabolic disorders including T2DM. A study concluded that yoga-based intervention program is a possible risk reduction option for the adults with high risk for T2DM. Similarly, an 8-week yoga intervention showed a positive effect on behavioural health outcomes in patients with T2DM. In a recent meta-analysis conducted with a total of 12 RCTs on T2DM, the pooled weighted mean reduction was 0.47 for HbA1c. The results of a recent study reported that the yoga is effective in reducing the blood glucose levels in patients with T2DM. An important RCT has reported that the HbA1c levels reduced significantly by 14.17% in yoga group after nine months of interventions (the HbA1c reduced 0.50 % in exercise group). The study also reported that yoga was better than physical exercise in decreasing oral hypoglycaemic medication requirement in T2DM.

In this study, Fasting Blood Sugar (FBS) level reduced significantly by 9.64 mg/dl (7.20%) in yoga group and it reduced insignificantly by 5.11 mg/dl (3.92%) in exercise group. Similarly, the Post-prandial Blood Sugar (PPBS) reduced significantly in yoga group by 14.6% in yoga group and by 8.9% in exercise group after 9 months of intervention. Another study conducted in Cuba demonstrated that mean FBS reduced by 29.48% in yoga group and 27.43% in exercise group after six months of intervention. Further, an 8-week yoga intervention appeared to be an effective lifestyle intervention to reduce weight-related T2DM risk factors and to improve psychological well-being.

Yoga interventions have multiple benefits for individuals with or at risk for T2DM as yoga intervention was found
to be effective in improving the blood glucose levels in patients with T2DM.\(^{42,43}\) A 40-day yoga intervention resulted in reduced Body Mass Index (BMI), improved well-being and reduced anxiety in patients suffering from T2DM.\(^{44}\) Yoga interventions can also be used as an effective therapy in reducing oxidative stress along with BMI in T2DM.\(^{45}\) Yoga-based lifestyle intervention including exercise and stress management training can also reduce elevated lipid levels in patients with T2DM.\(^{46}\) Yoga postures can also be practised with proper diet and regular drugs in the management of T2DM.\(^{47}\) Yoga-based interventions not only improved glycaemic control but also improved nerve function in patients suffering from mild to moderate T2DM with sub-clinical neuropathy.\(^{48}\) Table 1 provides the details of controlled studies on yoga for Type 2 Diabetes Mellitus.

**DISCUSSION**

Yoga intervention appeared to be more effective in T2DM as compared to physical exercise intervention which may be because of various aspects of yoga other than the physical one. The yoga intervention involves subtle components such as mindfulness, relaxation, breath regulation, and notional corrections. Those components would have enhanced the mood and the state of mind of the patients with T2DM.\(^64,65\) Whereas the patients in the physical exercise group would have done so more mechanically which would have led to the benefits at the body level only.

The mechanism through which yoga works may be the down-regulation of the sympathetic nervous system and the hypothalamic-pituitary-adrenal axis\(^66\) which may lead to the improvement in psychological health, quality of sleep, autonomic balance, and reduction in insulin resistance. The components of yoga such as mindfulness and relaxation may be the major contributors for the down-regulation of the sympathetic nervous system and the hypothalamic-pituitary-adrenal axis. Further, pranayama (breath regulation) also has the capacity to bring the mind in the present moment which helps to reduce the stress level.\(^67\) The reduction of stress level may result in better glycaemic control in patients suffering from T2DM as the stress has strong effects on metabolic activity by stimulating different hormones.\(^68\)

**WAYS FORWARD**

Yoga and physical exercise both appeared to be effective in improving glycaemic control in T2DM, however, yoga intervention appeared to be more effective than physical exercise intervention. Lifestyle modification programs such as yoga interventions on a regular basis for long duration have potential to manage and cure T2DM. The government and the concerned bodies should pay attention to this area.
